GREENFOND GREEN WALL green walls

GREENFOND GREEN WALL is a modular storage system for building vertical gardens outside and inside buildings

A garden in your apartment? In addition, occupying little space and not having problems with its watering? This is possible thanks to the modern Greenfond Garden system. The green wall can be created inside as well as outside – in a garden, on a terrace or balcony.

A revolutionary solution is now at your fingertips! The greenery around us provides a lot of advantages, better comfort and healthy air.

The "green wall" is decorative and functional at the same time. On a small surface, you can plant a lot of plants where it was not possible before or it was very limited. Needless to convince anyone that plants create a friendly and healthy microclimate for people, clean and moisturize the air, supply oxygen, create a sound-absorbing wall. Plants also have the ability to absorb harmful substances from the air. Also, the more of them will be in our environment, the better.

WHAT IS GREENFOND GARDEN? APPLICATION.

Greenfond Garden is a system that does not require costly, cumbersome reworking of existing walls, because it is an attractive decoration of vertical surfaces as they are. Vertical gardens prove to be the original arrangement of walls in public places such as shopping centers, cafes, restaurants, shop windows, but also in private apartments, gardens and on terraces. Due to the abundant vegetation layer, they can serve as natural soundproof screens. The flower walls perfectly replace traditional hedges and introduce fresh and modern style into the interior. They work very well as partitions in offices, restaurants and many other places. The system allows you to develop a wall of any size.

We build a vertical garden from individual modules. One module is a box with two holes for two plants. The modules are designed so that they connect to one another like blocks to form a wall in any shape and size. The size of the green / floral matrix can be modified also during the period of use - by attaching further elements and thus increasing the surface of the hanging garden.

GREENFOND GREEN WALL

 green walls

INNOVATIVE IRRIGATION SYSTEM.

The whole structure is extremely well thought out in terms of economical and easy watering. With only one connection, eg. a garden hose (it must be run horizontally and cover all the elements of the highest level of the flower wall), waters the entire wall. Water delivered to the top floor with special overflow openings will get to the lower floors (to each module). In this way, each plant is flooded in the right amount.
