

## PRODUCT CARD

**GREENFOND**  
**LK** edge strip

GREENFOND LK edge strip used as a finish (attic, eaves) on roofs up to 35% inclination, enabling the outflow of water into the gutter

GREENFOND LK edge strip for green roofs is used as a closing edge. The GREENFOND LK edge strip ensures free drainage of rainwater through appropriately cut openings on its surface and in the case of a pitched green roof, it constitutes an additional support for the roof layers system.

INSTALLATION RECOMMENDATIONS: The installation of the strip requires permanent fixing to the ground, therefore the installation should be performed before the laying of the waterproofing layer. The standard height of the strips is 8, 12, 15, 20 and 25 cm, length 2 m, and is made of 1.5 mm thick aluminum. Depending on aesthetic and design requirements, we can offer powder coated strips in a selected color according to RAL.
