SEDUM MATT P stonecrop mat

GREENFOND SEDUM MATT P stonecrop mat - a mixture of stonecrops appropriately selected in the form of a mat fixed in a board for use on green roofs

GREENFOND SEDUM MATT P stonecrop mat - a mixture of stonecrops selected in the form of a mat in a board for use on green roofs. The advantage of this solution is that you do not have to wait for the crop effect. Once you have located it, you can enjoy the beautiful green roof.

GREENFOND SEDUM MATT P ready-made stonecrop mat is a guarantee of a spectacular extensive green roof just after unfolding, which cannot be obtained in the case of an extensive roof by traditional sowing with stonecrop shoots or planting of seedlings from multiplates. Notwithstanding harsh weather conditions or lack of care in the first growth phase as in the traditional method of sowing or planting of seedlings, our mat does not extend the waiting time for the desired effect.

Another advantage is that buying the mat we guarantee that it is exactly the type you have chosen, with regular density of plants and what is more, devoid of weeds and other impurities. This gives measurable benefits in the form of time and financial savings for additional care treatments.

SEDUM MATT P stonecrop mat

RECOMMENDATION AND UTILIZATION RECOMMENDATIONS

The extensively green roof practically requires small expenditures and care treatments.

Mainly, maintenance work is limited to removal of weeds and pollutants brought by the wind and periodic application of the fertilizer.

In addition, stonecrop plants are appropriately strong, so they are also not damaged when walking on them during these treatments.

Recommendations immediately after installation

In the initial phase, the stonecrop mat requires a sufficient amount of moisture, so after finishing the assembly works, it should be gently watered and then it should be monitored regularly for one month. If necessary, water it periodically, especially during warm and dry periods.

Regular annual care treatments

The green roof made with the use of the mat should be inspected at least once a year, checking the presence of weeds and seeds brought by the wind and removing them by hand. It is best to carry out this treatment in spring, before weeds begin to flower. To preserve the natural development of plant biodiversity, the use of chemical pesticides is not recommended. The amount of greenery located near the roof affects the frequency of green roof control. The control activities also include checking the correct functioning of the drainage system. The works consist in removing contaminants that are found in gutters and outflows, i.e. leaves, branches, etc.

Fertilization

We recommend the use of properly selected YaraMila fertilizer Hydrocomplex, periodically every 12 months. The fertilizer is best used in spring, i.e. in April or May. This treatment particularly applies to green roofs made in lightweight construction technology.

SEDUM MATT P stonecrop mat

TECHNICAL DATA OF THE PRODUCT:

Product type	Stonecrop mat in the board
Thickness	2-4 cm substrate + plants
Number of varieties	6-8 plants

NAME	ART. NO	BOARD DIMENSIONS
GREENFOND SEDUM MATT P	35.1205	0,8 x 1,2 m / 1m ²
	35.1206	1,0 x 1,0 m / 1m ²

APPLIED PLANTS IN THE MAT:

Sedum stonecrop - sedum acre ;

stonecrop white - sedum album;

Sedum stonecrop - sedum floriferum;

sedum stoner - sedum hybridum;

Sedge Sedum - sedum reflexum;

stonecrop album from caucasian - sedum spurium album superbum;

Sedum stoner fuldaglut - sedum spurium fuldaglut;

six- row sedum - sedum sexangulare;

the other hernixes - sempervivum, calcareous - calcareum, mountain - montanum
