# GF-T/XYZ terrace systems

GREENFOND GF-T / XYZ is a quick and trouble-free installation of terrace floors

GREENFOND GF-T / XYZ allows you to build raised terraces in a quick and easy way.

Thanks to the universal design, the XYZ system can be used for terrace boards as well as for laying terraces on joists. The XYZ system consists of 3 elements.

### UPPER SUPPORT X

The X-adjustment is the upper element of the XYZ system and comes in two variants: with joints for terrace boards and with joist clamps. The adjustment is on a standard M10 screw and the height range is +/- 20 mm. If there is a need to raise the floor in the range of 60-80 mm, the X adjustment can be used with the central Y support and constitute an independent system.

### CONNECTOR Y

It is a universal element, in the XYZ system is a connector between the bottom base and the PVC tube adapter (reinforced) and the upper adjustment. However, in the XY system it is its bottom basis.

### LOWER BASE Z:

In the bottom "Z" base, press in the PCV pipe (reinforced) to which we put "XY" - the element "Y" with the cone down. The height adjustment in the "XYZ" system is obtained in two places, by using the desired length of the PVC pipe and on the upper "X" regulation ( here we have a range of +/- 20 mm height). The "Z" base has a diameter of 200 mm, thus providing stable support for terraces up to a height of 400 mm. The large diameter of the base allows the installation of our system on thermal insulations (styrofoam, polyurethane foam).
